

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

LISTING OF CLAIMS:

1. (Currently amended) A device for detecting interactions between a first species attached to a support and a second species present in a liquid, when said support and said liquid containing said second species are brought into contact; comprising a solid support (11) on which ~~a~~ said first species can be attached in one or more non-overlapping defined areas thereon; a detector (12) capable of detecting an interaction between said first species attached to the solid support, and said second species contained in said liquid; characterized by a mechanism (16) adapted for temporarily reducing, in a defined area of said support, and in the course of a detection, the amount of liquid containing said second species with which said support is brought into contact ~~in the course of a detection~~; and in that at least one of the defined areas ~~do~~ does not have ~~a~~ said first species ~~of interest~~ attached, so as to form a reference area for the detection.

2. (Original) Device as claimed in claim 1, wherein said solid support is an essentially flat dish capable of holding a liquid confined within its boundaries.

3. (Previously presented) The device as claimed in claim 2, wherein there is provided a motor for enabling rotation of the dish at an angle deviating from the horizontal, so as to provide for a temporary reduction of the amount of liquid in said defined area of said support.

4. (Previously presented) The device as claimed in claim 1, wherein there is provided an aspirating device for aspirating liquid from said support before measurement, and for returning liquid to the support after measurement.

5. (Currently amended) The device as claimed in claim 1, wherein the detector (12) is a scintillation detector, and wherein there is further provided an electronic counter device (13) for counting the impulses from the detector (12), and a control unit for adjusting and reporting the angular position of the support (11), and a computer (15) for synchronizing scintillation counter output from the counter (13) and the angular position of the ~~cell-dish~~ support from the control unit (14).

6. (Original) A method of detecting interactions between species in a liquid and species on a solid support, comprising: attaching a first species on a defined portion of a solid support; exposing said first species to a liquid containing

a second species, so as to cover the defined portion of the solid support; performing a measurement, capable of detecting an interaction between said first and said second species; characterized in that the amount of liquid covering the defined portion of the support is temporarily reduced prior to performing said measurement; a reference measurement is performed on a different portion of the solid support where no interaction takes place, said portion defining a reference area.

7. (Original) The method as claimed in claim 6, wherein the interactions on all defined areas are detected within 1 minute, and the detection of all interactions are repeated without interruption during at least 15 minutes in order determine the progress of the interaction over time.

8. (Previously presented) The method as claimed in claim 6, wherein said temporary reduction of liquid comprises a reduction of the amount of liquid near at least one of said defined areas without changing the total amount of liquid in contact with said solid support.

9. (Previously presented) The method as claimed in claim 6, wherein a difference between target and reference measurements is calculated.

10. (Previously presented) The method as claimed in claim 6, wherein the sequence of steps of exposing, reducing the amount of liquid, and measuring is repeated, and wherein the concentration of said second species is increased by a finite amount before said sequence of steps is repeated.

11. (Previously presented) The method as claimed in claim 6, wherein the solid support is an essentially flat dish capable of holding a liquid confined within its boundaries.

12. (Previously presented) The method as claimed in claim 6, wherein the reduction of the amount of liquid is achieved by orienting the support at an angle that deviates from the horizontal to provide an elevated part and a lower part of said support, such that the elevated part will be covered by less liquid than the lower part, and wherein the support is rotated at a predetermined speed of rotation.

13. (Previously presented) The method as claimed in claim 6, wherein the first species is selected from tissues, cells, bacteria, virus particles.

14. (Previously presented) The method as claimed in claim 6, wherein the second species present in the liquid is a

dissolved molecule or a dissolved complex of molecules with a total molecular weight less than 1000000 g/mole.

15. (Previously presented) The device as claimed in claim 2, wherein there is provided an aspirating device for aspirating liquid from said support before measurement, and for returning liquid to the support after measurement.

16. (Previously presented) The device as claimed in claim 3, wherein there is provided an aspirating device for aspirating liquid from said support before measurement, and for returning liquid to the support after measurement.

17. (Previously presented) The device as claimed in claim 2, wherein the detector (12) is a scintillation detector, and wherein there is further provided an electronic counter device (13) for counting the impulses from the detector (12), and a control unit for adjusting and reporting the angular position of the support (11), and a computer (15) for synchronizing scintillation counter output from the counter (13) and the angular position of the cell dish support from the control unit (14).

18. (Previously presented) The device as claimed in claim 3, wherein the detector (12) is a scintillation detector,

and wherein there is further provided an electronic counter device (13) for counting the impulses from the detector (12), and a control unit for adjusting and reporting the angular position of the support (11), and a computer (15) for synchronizing scintillation counter output from the counter (13) and the angular position of the cell dish support from the control unit (14).

19. (Currently amended) The device as claimed in claim 4, wherein the detector (12) is a scintillation detector, and wherein there is further provided an electronic counter device (13) for counting the impulses from the detector (12), and a control unit for adjusting and reporting the angular position of the support (11), and a computer (15) for synchronizing scintillation counter output from the counter (13) and the angular position of the ~~cell dish~~ support from the control unit (14).

20. (Previously presented) The method as claimed in claim 7, wherein said temporary reduction of liquid comprises a reduction of the amount of liquid near at least one of said defined areas without changing the total amount of liquid in contact with said solid support.
